

Summary of safe operation and maintenance of energy storage batteries

What are the guidelines for battery management systems in energy storage applications?

Guidelines under development include IEEE P2686 "Recommended Practice for Battery Management Systems in Energy Storage Applications" (set for balloting in 2022). This recommended practice includes information on the design, installation, and configuration of battery management systems (BMSs) in stationary applications.

What's new in energy storage safety?

Since the publication of the first Energy Storage Safety Strategic Plan in 2014, there have been introductions of new technologies, new use cases, and new codes, standards, regulations, and testing methods. Additionally, failures in deployed energy storage systems (ESS) have led to new emergency response best practices.

Are energy storage safety incidents a threat to first responders?

However, safety incidents in the field have still led to total BESS destruction and posed risk to first responders. Despite the efforts of the energy storage industry to improve system safety, recent incidents show the need for a greater recognition of the limitations of current practices.

What is a battery energy storage system?

Battery Energy Storage System (BESS): Battery Energy Storage Systems, or BESS, are rechargeable batteries that can store energy from different sources and discharge it when needed. BESS consist of one or more batteries. **Personal Mobility Device:** Potable electric mobility devices such as e-bikes, e-scooters, and e-unicycles.

Why are battery energy storage systems becoming more popular?

This recognition, coupled with the proliferation of state-level renewable portfolio standards and rapidly declining lithium-ion battery costs, has led to a surge in the deployment of battery energy storage systems (BESS).

What are energy storage safety gaps?

Energy storage safety gaps identified in 2014 and 2023. Several gap areas were identified for validated safety and reliability, with an emphasis on Li-ion system design and operation but a recognition that significant research is needed to identify the risks of emerging technologies.

This standard applies to: (1) Stationary battery energy storage system (BESS) and 1 mobile BESS. (2) Carrier of BESS, mainly includes but not limited to lead acid battery, lithium-ion battery, flow battery and sodium-sulfur battery; (3) BESS used in electric power system (EPS). This standard also mainly provides alternatives for connection (including DR interconnection), ...

It is difficult to unify standardization and modulation due to the distinct characteristics of ESS technologies.

DOB Bulletin 2019-007 - adopted 9/26/19 Clarifies the applicable zoning use group and limitation

It is strongly recommend that energy storage systems be far more rigorously analyzed in terms of their full life-cycle impact. For example, the health and environmental impacts of compressed air and pumped hydro energy storage at the grid-scale are almost trivial compared to batteries, thus these solutions are to be encouraged whenever appropriate.
