The development of smart grids has offered many technical solutions that can increase the reliability and resilience of distribution systems. Self-healing is an important characteristic of smart grids, as it pertains to the capability of the grid to isolate and restore the system, or part of it, to its normal operation following interruptions.

Self-Healing The self-healing application reduces outage time through the early detection of fault location. The application's algorithm identifies the location of the fault and isolates the damaged section; it then reconfigures the section by closing the normally open points of the grid to restore supply to consumers.

The grids that can do this are called smart grids. One of the most important features of smart grids is; in the
