

What is niobium & tantalum?

Niobium (Nb) and tantalum (Ta), transition metals with distinct physical and chemical properties, are highly attractive for applications in electrochemical energy storage (EES) devices. Their oxides, dichalcogenides, and MXenes demonstrate significant potential due to effective ion-diffusion channels and high theoretical capacity.

Does tantalum increase oxygen vacancy formation energy and decrease lithium-ion migration energy barrier?

In this study, we propose the strategy of introducing tantalum (Ta) to increase oxygen vacancy formation energy and decrease lithium-ion migration energy barrier of single-crystal $\text{LiNi}_{0.9}\text{Co}_{0.05}\text{Mn}_{0.05}\text{O}_2$ (NCM90) cathode materials.

How does tantalum affect chemistry?

Finally, tantalum lowers the interfacial reactivity, decreases the side reactions between the electrolyte and cathode material, thereby contributes to a thinner and more uniform CEI layer, which composes fewer organic species yet more inorganic species.

Why should tantalum doping be assigned to a decreased energy barrier?

The decreased energy barrier should be assigned to tantalum doping decreasing the valence state of Ni and expanding the diffusion channels, thereby accelerate the Li⁺ diffusion kinetics and enhancing the electrochemical performance.

Does tantalum doping affect crystalline structure?

The results indicate that tantalum doping significantly influences the crystalline structure of the material. Specifically, a lattice distortion phenomena induced by tantalum doping was observed, resulting in changes to the cell parameters to a certain extent.

Does trace tantalum doping suppress lattice oxygen vacancy formation?

DFT calculations reveal that the oxygen vacancy formation energy of NCM90-Ta0.6 % is 7.28 eV, significantly higher than that of the original sample NCM90 (6.26 eV) (Table S4 and Fig. 5 a). This suggests that the introduction of trace tantalum doping can effectively suppress the liberation of lattice oxygen throughout cycling processes.

Battery, flywheel energy storage, super capacitor, and superconducting magnetic energy storage are technically feasible for use in distribution networks. With an energy density of 620 kWh/m³, Li-ion batteries appear to be highly capable technologies for enhanced energy storage implementation in the built environment. Nonetheless, lead-acid ...

Tantalum and Tantalum Polymer capacitors are suitable for energy storage applications because they are very efficient in achieving high CV. For example, for case sizes ranging from EIA ...

Generation and Related Energy Carrier Hui-Min Yang and Zhong-Yong Yuan* Key Laboratory of Advanced Energy Materials Chemistry (Ministry of Education), School of Materials Science and Engineering, Nankai University, Tianjin 300350, China *Email: zyyuan@nankai.cn The hydrogen generation and storage are the main barriers hindering the rapid

capability for future electrochemical energy storage devices.[3,10] Addressing these and other related issues is crucial for the advancement of LIBs and the broader adoption of renewable energy technologies. Recently, there has been a lot of interest in using Nb- and Ta-based materials as electrode materials for EES devices.[1,11]

Here we report on a novel supercapacitor electrode based on IrO₂-Ta₂O₅ nanoparticles supported on WO₃ nanoplatelets. The nanoplatelets were directly grown on a W ...

The wide application of MXenes in electrochemical energy storage and electrocatalysis is closely related to their excellent electronic performance [98]. Recently, through theoretical calculations, the factors affecting the electronic properties of MXene have been explored, such as different M, X, and functional groups on its surface [113], [114].

Niobium (Nb) and tantalum (Ta), transition metals with distinct physical and chemical properties, are highly attractive for applications in electrochemical energy storage (EES) devices. Their oxides, dichalcogenides, ...

Energy storage devices like a rechargeable battery and supercapacitor need continuous improvement in their performance as there is a long-lasting demand for rechargeable devices which have very high specific energy and charges quickly. In the last three decades, different attempts have been made to improve the performance of energy storage devices.
