

What is a buffer or thermal energy storage tank?

Buffer or thermal energy storage tanks provide an effective solution for precisely managing thermal energy loads in cooling and heating systems. When paired with buffer tank storage, heat pumps, chillers, and boilers can operate continuously at peak performance rather than fluctuating in response to demand spikes.

What is a buffer storage tank?

In buffer storage tanks with two or more heat exchangers - systems with a higher temperature are connected to the upper heat exchangers, and with a lower one - to the lower ones. The buffer storage tank connected to the solid fuel boiler must store the heat generated by at least one boiler loading.

Why do data centres need a buffer tank?

Data centres and industrial facilities often experience significant cooling or process load spikes during daily peak periods. A buffer tank in thermal energy storage tank for chilled water or heated water can be used overnight and on weekends when demand and electricity rates are lower.

How much energy does a buffer storage tank accumulate?

For example, if we have a buffer storage tank with a volume of 1000 liters (further on, the mass of 1 liter of water is assumed to be equal to 1 kg) and we heat it to 50°C , then it will accumulate heat energy $1000 \times 50 = 50,000 \text{ kcal} = 0.05 \text{ Gcal} = 58 \text{ kWh}$.

What are the benefits of a buffer tank?

Buffer tanks greatly benefit residential and commercial space heating. They enhance thermal comfort through steady temperature control and minimize boiler or heat pump cycling. By allowing heat pumps to operate continuously during off-peak hours, buffer tanks also reduce energy costs.

Who should choose a buffer storage tank?

The priority in selecting a buffer storage tank will be the consumer, if it is necessary to cover a given heat load in a certain time, for example: In heating systems in which the source of heat is an electric boiler that works only during the reduced night tariff.

Calculation of the buffer storage tank consists of determining the accumulative capacity of the stored volume of water. The accumulative capacity of water is characterized by heat capacity equal to $4.187 \text{ kJ} \cdot \text{kg}^{-1} \cdot ^{\circ}\text{C}^{-1}$.
