

Technical issues of energy storage frequency regulation

Can battery energy storage system regulate system frequency?

Battery energy storage system (BESS) has been regarded as an effective technology to regulate system frequency for power systems. However, the cost and the system security of battery energy storage are the bottle necks for the battery energy storage system to be applied to practical projects for frequency regulation.

Can a distributed control strategy support frequency regulation in power systems?

Abstract: In this paper a distributed control strategy for coordinating multiple battery energy storage systems to support frequency regulation in power systems with high penetration of renewable generation is proposed.

Do energy storage stations improve frequency stability?

With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system. The energy storage (ES) stations make it possible effectively. However, the frequency regulation (FR) demand distribution ignores the influence caused by various resources with different characteristics in traditional strategies.

Why do power systems need frequency regulation capacity?

With the increasing penetration level of renewable energy, the requirement of frequency regulation capacity of power systems are greatly increased and the resilience of power systems under extreme natural events are reduced accordingly, .

Why is frequency regulation important in energy systems?

Due to the very high penetration of energy systems, there is a need for frequency regulation, hence different control strategies are employed to overcome this problem.

What are energy storage systems used for?

The energy storage systems are used for controlling the frequency of the system[25]. To compensate for the mismatch of generation-load, an advanced energy storage system is proposed in the paper so that the nominal frequency of the power system is maintained.

With a low-carbon background, a significant increase in the proportion of renewable energy (RE) increases the uncertainty of power systems [1, 2], and the gradual retirement of thermal power units exacerbates the lack of flexible resources [3], leading to a sharp increase in the pressure on the system peak and frequency regulation [4, 5]. To circumvent this ...

wind-storage combined frequency regulation system considering SFD. With the inspiration of the technical and economic characteristics of wind-storage combined frequency regulation, we aimed to effectively solve the problem of the energy storage capacity allocated without considering SFD (Peng et al., 2019;

Frequency is a crucial parameter in an AC electric power system. Deviations from the nominal frequency are a consequence of imbalances between supply and demand; an excess of generation yields an increase in frequency, while an excess of demand results in a decrease in frequency [1]. The power mismatch is, in the first instance, balanced by changes in the kinetic ...

The multi-microgrid has been attracted extensive attention for enhancing renewable energy utilization. The power fluctuation and load disturbance can lead to frequency deviation ...

Historically, utilities were able to avoid frequency regulation issues by maintaining on-line generating capacity at a level that was always higher than expected peak demand. In ORNL graph, that ...

In view of DER-integrated energy networks, a sudden generation loss under extreme conditions and renewable energy uncertainties pose severe frequency regulation issues [12]. One of the issues identified in the operation of the grid for frequency stability is the control input malfunction in load frequency control (LFC) [9]. For stable operation of a hybrid power ...

Secure and economic operation of the modern power system is facing major challenges these days. Grid-connected Energy Storage System (ESS) can provide various ancillary services to electrical networks for its smooth functioning and helps in the evolution of the smart grid. The main limitation of the wide implementation of ESS in the power system is the ...

Rahman et al. [23] studied the evaluation of four stationary application scenarios, i.e., high-capacity energy storage, transmission and distribution investment delay, frequency regulation, and voltage regulation support, to assess the techno-economic feasibility of five electrochemical battery storage technologies.

Recent studies [30], [149], [151], [152] on energy storage technology have focused on energy storage array control, especially in practical applications. Optimizing the running state of each energy storage unit in the system according to the characteristics of the unit is a potential optional for power penetration.

Therefore, frequency regulation has become one of the most important challenges in power systems with diminishing inertia [1,2]. In modern power grids, energy storage systems, renewable energy generation, and demand-side management are recognized as potential solutions for frequency regulation services [1, 3-7].

Building a sustainable, resilient and decarbonize power system with high penetration level of renewable energy is the target of smart grid [1], [2], [3]. With the increasing penetration level of renewable energy, the requirement of frequency regulation capacity of power systems are greatly increased and the resilience of power systems under extreme natural ...

Due to the integration of hybrid renewable resources (RRs), it has become more costly to perform frequency regulation solely from conventional resources [1]. Alternatively, in addition to growing conventional generators, the distributed energy resources (DERs) are expanding more to satisfy the dynamic loads.

The integration of renewable energy into the power grid at a large scale presents challenges for frequency regulation. Balancing the frequency regulation requirements of the system while considering the wear of thermal power units and the life loss of energy storage has become an urgent issue that needs to be addressed.
