How can phase change materials help a low carbon/green campaign?

Reutilization of thermal energy according to building demands constitutes an important step in a low carbon/green campaign. Phase change materials (PCMs) can address these problems related to the energy and environment through thermal energy storage (TES), where they can considerably enhance energy efficiency and sustainability.

Are inorganic phase change materials better than organic?

In general, inorganic phase change materials have double the heat storage capacity per unit volume as compared with organic materials, which can be seen from the comparison in Table 1. They have a higher thermal conductivity, a higher operating temperature, and lower cost relative to organic phase change materials.

What is phase change material (PCM) and thermal energy storage (TES)?

Phase Change Material (PCM); Thermal Energy Storage (TES). Thermal energy storage (TES) is defined as the temporary holding of thermal energy in the form of hot or cold substances for later utilization. Energy demands vary on daily, weekly and seasonal bases.

Can phase changing materials store energy?

Phase-changing materials are nowadays getting global attention on account of their ability to store excess energy. Solar thermal energy can be stored in phase changing material (PCM) in the forms of latent and sensible heat.

Are inorganic phase change materials suitable for building integration?

Summary and conclusions In this review work, inorganic phase change materials (iPCMs) have been discussed with their properties and key performance indicators for building integration. The selection of these iPCMs mainly depends on thermophysical properties, mechanical properties soundness during phase transition and compatibility.
