

The reason why Europe's electricity prices fell and the demand for energy storage decreased

Why did electricity demand decrease in Europe?

The overall decline in electricity demand across the European Union was driven by mild weather. However, this was partially offset by hotter summer weather in southern Europe, especially during heatwaves.

Why are electricity prices rising in Europe?

Because of the rise in gas prices, electricity prices in some European wholesale markets have increased by 200 per cent in the last year. Following the approval of stricter EU climate goals for 2030 and 2050, the EU's carbon price under the ETS increased from about EUR30 per tonne at the start of 2021 to over EUR60 now.

Do negative electricity prices affect electricity bills in Europe?

Electricity prices in Europe have recently reached negative values. A drop below zero was recorded in a number of countries against the backdrop of maximum output from solar power plants. RBC-Ukraine explains what negative prices are, why they are even possible in Europe, and whether they affect electricity bills.

What was the main focus of the energy crisis in Europe?

Following Russia's invasion of Ukraine, the world has been experiencing its first truly global energy crisis, which has caused prices to soar and disrupted energy trade flows. While natural gas supply to Europe was front and centre of the crisis, the ripple effects have been felt throughout the energy industry and across all regions of the world.

What happened to energy prices in Europe?

According to the European exchange Epex Spot SE, prices in Germany fell to -17.73 euros/MWh between 13:00 and 14:00 on March 3. Prices in the Netherlands and Belgium also fell below zero. Negative prices are becoming increasingly common in Europe as renewables flood the grid and supply outstrips demand.

How do negative prices affect energy prices in Europe?

Negative prices are becoming increasingly common in Europe as renewables increase their share in an effort to reduce carbon emissions. Wind power, for example, can spike or fall sharply in a matter of hours, while increased solar power creates excess supply during the day when generation peaks.
