Why is energy storage important?

As the penetration of renewable resources (e.g. wind and solar) into the grid energy mix continues increase, energy storage is needed to change and optimise the output from renewable sources so as to mitigate rapid and seasonal output changes which occurs as a result of the intermittency in energy supply from aforementioned renewable resources.

Energy Storage Systems (ESS) are expected to play a significant role in regulating the frequency of future electric power systems. Increased penetration of renewable generation, and reduction in the inertia provided by large synchronous generators, are likely to increase the severity and regularity of frequency events in synchronous AC power systems.

Role of long-duration energy storage: The California Energy Commission defines storage capable of discharging for over 10 h at its maximum discharging power as long-duration storage [17]. Typical characteristics of long-duration storage include low round-trip efficiency, large storage capacity, and high power-capacity costs.

The useful life of electrochemical energy storage (EES) is a critical factor to system planning, operation, and economic assessment. Today, systems commonly assume a physical end-of-life criterion: EES systems are retired when their remaining capacity reaches a threshold below which the EES is of little use because of insufficient capacity and efficiency.
