This method is mainly used for wind consumption and energy storage of large-scale wind site, and the route is shown in Fig. 4 [73]. For the off-grid system, the electrical energy is produced by a single fan or multiple fans which is directly provided to electrolysis equipment without going through the grid for hydrogen production.

Hydrogen has the highest energy content per unit mass (120 MJ/kg H₂), but its volumetric energy density is quite low owing to its extremely low density at ordinary temperature and pressure conditions. At standard atmospheric pressure and 25 °C, under ideal gas conditions, the density of hydrogen is only 0.0824 kg/m³ where the air density under the same conditions ...
