A thermal energy storage system is a system that stores thermal energy for later use. It typically consists of a hot and cold store, compressors, turbines, and generators. The storage mediums could include molten salt, molten aluminum, molten silicon, etc. When discharging, the temperature differential between the cold and hot stores is used to convert thermal energy back into electricity.

What is stored in a pumped thermal energy storage system?

Pumped thermal energy storage systems consist of a hot and cold store, compressors, turbines and generators. Electricity is used to clean, compress and cool to liquefy air/nitrogen and stores energy in the form of liquid air in a tank. When discharging, the liquid air is pumped, evaporated and the expansion of air is used to drive a turbine.
