The device, known as an electromagnetic launch system, or electromagnetic catapult, was designed by Chinese engineers to assist planes taking off from aircraft carriers.

Unlike steam catapults, which use pressurized steam in more of what developers call a "shotgun" effect, a launch valve and a piston to catapult aircraft, EMALS uses a precisely determined amount of electrical energy. Therefore, EMALS is designed to more smoothly launch aircraft while reducing stress and wear and tear on the airframes ...

The real electromagnetic gun, the electromagnetic catapult on the aircraft carrier, and the "electromagnetic sled" in Jinan are all similar in principle. They all use electromagnetic energy to shoot objects out. At present, the power generated by chemical energy has its limits, as does the ability of working medium rockets.

The difficulty of electromagnetic launch is energy storage, and by 2010 the key energy storage equipment for Electromagnetic catapult was a 50MW/120MJ flywheel prototype. This...

be seen from Fig. 1, the resultant eld pattern would just move with the wire, so that there is no "relaxation" of eld lines to minimize the magnetic energy. In lieu of any support from physical reasoning, it might nevertheless be ...

What energy storage does China use for electromagnetic catapults Potential energy is the stored energy in any object or system by virtue of its position or arrangement of parts. However, it isn't affected by the environment outside of the object or system, such as air or height. On the

Catapult Physics. Catapult physics is basically the use of stored energy to hurl a projectile (the payload), without the use of an explosive. The three primary energy storage mechanisms are tension, torsion, and gravity. The catapult has proven to be a very effective weapon during ancient times, capable of inflicting great damage.
