What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges from the grid or a power plant and then discharges that energy to provide electricity or other grid services when needed.

When are battery storage systems most useful?

Battery storage systems will play an increasingly pivotal role between green energy supplies and responding to electricity demands. Battery storage, or battery energy storage systems (BESS), are devices that enable energy from renewables, like solar and wind, to be stored and then released when the power is needed most.

How does a battery storage system function?

A battery storage system works by being charged by electricity generated from renewable energy sources like wind and solar power. Intelligent battery software uses algorithms to coordinate energy production and computerised control systems are used to decide when to store energy or release it to the grid.

When can energy be stored in batteries?
