Additional, there is more energy loss from the transport and storage of the produced hydrogen. Hydrogen has low density in gas and liquid format, so to achieve sufficient energy density we have to increase its actual density. The most efficient method is to compress the hydrogen to 680 atm but

The efficiency of energy storage by compressed hydrogen gas is about 94% (Leung et al., 2004). This efficiency can compare with the efficiency of battery storage around 75% (Chan, 2000; Linden, 1995). It is noted that increasing the hydrogen storage pressure increases the volumetric storage density (H2-kg/m 3), but the overall energy
