Do crystal structures occupy overlapping regions of energy-density space?

A first observation is that crystal structures in the a and v funnels occupy overlapping regions of energy-density space, so that the traditional CSP energy-density representation does not convey the important information about which structures belong to connected regions of the high-dimensional energy landscape.

Is cocrystal formation predictable?

Overall, it appears that cocrystal formation should generally be predictable by comparing the relative stability of the most stable cocrystal and its pure components found on the computed crystal energy landscapes, but this is often very demanding of the accuracy of the method used to calc. the crystal energy.

What is the relative thermodynamic stability of a cocrystal?

We define the relative thermodynamic stability of the cocrystal as (1) where Etot is the total energy of a crystal structure per formula unit of constituent (s): Etot (A m B n) is the calculated energy of the cocrystal; Etot (A) and Etot (B) are energies of the single-component crystal structures of coformers A and B, respectively.

whether a genuine time crystal exists in this system, we are going to look for the lowest-energy solution in the frame moving with a velocity u. Among the various energy storage devices, lithium-ion batteries (LIBs) have attracted significant attention because of their long cycle life, high energy density, and environmental benignity [12, [102], [103], [104]]. Capacity, stability, and safety are the key factors of LIBs however, most of the electrode materials suffer from these issues.
