Compressed hydrogen storage requires high-pressure tanks and has limited capacity. Liquefaction requires cryogenic temperature and consumes a large amount of energy. Solid-state hydrogen storage (SSHS) has the potential to offer high storage capacity and fast kinetics, but current materials have low hydrogen storage capacity and slow kinetics.

Among all introduced green alternatives, hydrogen, due to its abundance and diverse production sources is becoming an increasingly viable clean and green option for transportation and energy storage.

The combustion of 1 m<sup>3</sup> (one cubic meter) of hydrogen produces 12.7 MJ (Megajoules) of energy, which is a very high energy potential, although it is lower than that of methane (40 MJ). Since the energy needed for the production of one unit of hydrogen is higher than the energy produced by the hydrogen, the hydrogen is not considered as a source of ...
