Operational principle. The ESB-series outdoor base station system utilizes solar energy and diesel engines to achieve uninterrupted off grid power supply. Solar power generation is the use of photovoltaic panels to convert solar energy into electrical energy -48V DC, and then stabilize the load power supply through photovoltaic MPPT modules while charging the battery.

Simply put, its working principle can be broken down into three steps: Charging: When electricity prices are low or there is excess solar energy, the distributed energy storage cabinet stores this energy in its batteries. Storing: The batteries store the electrical energy in chemical form, ready to be released when needed.

Thermal energy storage processes involve the storage of energy in one or more forms of internal, kinetic, potential and chemical; transformation between these energy forms; and transfer of energy. Thermodynamics is a science that deals with storage, transformation and transfer of energy and is therefore fundamental to thermal energy storage.
