

We have explored the hydrogen storage capacity of zirconium doped psi-graphene employing Density Functional Theory. The Zr atom binds strongly on psi-graphene with a ...

For the first time, we predict through density functional theory that a single Zr atom attached on graphene surface can adsorb maximum of 9 H₂ ...

The zirconium metal-organic framework (Zr-MOF) is a promising material for hydrogen storage. Zr-MOF is well known for its high thermal stability and durability in various solvents [11, 12]. Researchers have used pristine Zr-MOF in a range of applications, including as an adsorbent [13], for methane storage [14], and as a catalyst [15]. Modification of Zr-MOF can ...

Facing the bottlenecks of slow hydrogen liberation rate and elevated dehydrogenation temperature of magnesium hydride (MgH₂) in practical applications, researchers have accomplished in-depth and extensive studies, aiming at finding effective solutions to promote its hydrogen storage performance this work, zirconium titanate (ZrTiO₄) consisting of ...

The main crisis that impedes the way to successful hydrogen generation for energy purposes is the paucity of efficient hydrogen storage materials. In First Principles calculations, we predict that zirconium atom adorned on the surface of an advanced carbon allotrope; penta graphene can attach 11 molecular hydrogens as a maximum, having average adsorption ...

The designed alloys reversibly adsorb and desorb hydrogen at room temperature, while the equilibrium pressure can be easily tuned to appropriately low values by reducing the hydrogen binding energy to more negative values via increasing the fraction of zirconium. The kinetics of hydrogen storage is quite fast in these alloys due to their Laves ...

Indeed, most previous studies of hydrogen storage by ZrCo were based on experiments. Ying et al. reported extended X-ray absorption fine structure (EXSF) and small angle X-ray scattering (SAXS) studies of Hf, Ti, Sc doping of Zr-Co [11] absence of hydrogen absorption, Ti and Hf doping lead to reduced Co-Zr distance and Sc doping has a negligible ...

We have explored the hydrogen storage capacity of zirconium doped psi-graphene employing Density Functional Theory. The Zr atom binds strongly on psi-graphene with a binding energy of -3.54 eV due to charge transfer from Zr 4d orbital to C 2p orbital.

The hydrogen (H₂) storage capacity of Zirconium (Zr) decorated zeolite templated carbon (ZTC) has been investigated using sophisticated density functional theory (DFT) simulations. The analysis shows that the Zr

atom gets bonded with ZTC strongly with binding energy (BE) of -3.92 eV due to electron transfer from Zr 4d orbital to C 2p orbital of ZTC.

We predict that each Zr atom decorated on graphyne sheet (2D) can adsorb up to seven H₂ molecules with an average adsorption energy of -0.44 eV/H₂, leading to a hydrogen ...

HYDROGEN STORAGE ALLOY MARKET SEGMENTATION By Type. Based on type, the market is divided into Titanium Hydrogen Storage Alloy, Zirconium Hydrogen Storage Alloy, Fe Hydrogen Storage Alloy, Rare Earth Hydrogen Storage Alloy, Mg Hydrogen Storage Alloy, and Others. Titanium Hydrogen Storage Alloy holds a major share of the global market. ...

We predict that each Zr atom decorated on graphyne sheet (2D) can adsorb up to seven H₂ molecules with an average adsorption energy of -0.44 eV/H₂, leading to a ...

It was seen clearly that all alloys could absorb the hydrogen without any incubation time. In addition, the maximum hydrogen storage capacity increased with adding zirconium content from 0 to 8. The lowest maximum hydrogen storage capacity was 1.210 wt% of x = 0 alloy. The highest maximum hydrogen storage capacity was 1.556 wt% of x = 8 alloy.

Abstract: In this work, we investigate the hydrogen-storage properties of Zr-decorated γ -graphyne monolayer employing Density Functional Theory (DFT) for ...

Fossil fuels have been the most employed energy source with a consistent and growing consumption; however, they will be replaced by renewable energy sources (RESs). Massively using this type of energy will require new materials, especially metallic-based materials, because the typical materials have shown poor performance. In particular, hydrogen obtained from ...

Metal decorated carbon-containing two-dimensional monolayers have been explored as potential hydrogen storage materials because of their open structures which improve the storage capacity. Here, the H₂ storage capability of the Zr ...

The hydrogen (H₂) storage capacity of Zirconium (Zr) decorated zeolite templated carbon (ZTC) has been investigated using sophisticated density functional theory (DFT) ...

This review supports the utilization of hydrogen as clean energy fuel and its possible storage measures. The review provides an imperative connection of the metal hydrides, including emerging high-entropy alloy ...

For solid-state storage, DoE has specified some criteria for a material to qualify as an effective storage material: a) the binding energy of absorption hydrogen must range between 0.2 and 0.7 eV, and b) the gravimetric weight percentage of hydrogen storage should be higher than 6.5 [19]. Before the arrival of carbon nanomaterials, various ...

The hydrogen storage behavior of the intermetallic compound ZrNi also has been investigated by many researchers [18], [19], [20]. The study by Libowitz et al. [18] revealed that this system has two stoichiometric hydride phases corresponding to compositions ZrNiH and ZrNiH₃. Hence, this system gives rise to two plateau regions in the pressure-composition ...

2D polyaramid (2DPA) is a porous and polymeric material that has been synthesized recently. Titanium and zirconium decoration over 2DPA increases their affinity for hydrogen substantially, making them suitable for ...

Employing the state-of-the-art Density Functional Theory (DFT) Simulations, we have investigated hydrogen storage capability in zirconium doped novel 2D heterostructures, Covalent Triazine Frameworks (CTFs), specifically CTF-1, rich in nitrogen functionalities. Zirconium atom is strongly bonded to the triazine framework with a -3.61 eV binding energy, ...

Using the FP-LAPW method within the WIEN2k code [36], several properties of zirconium-based perovskites ZrXH₃ (X = Zn, Cd) are explored. PBE-GGA exchange correlation potential is used to obtain the results. By varying energy versus volume, Birch-Murnaghan's equation of state is used to study the structural parameters and to find the stable phase of ...

Zirconium hydride precipitation and growth are directly affected by hydrogen atom transport properties, which would make nuclear fuel storage less safe over long periods of time. Herein, we employ first-principles calculations to investigate the hydrogen diffusion mechanism in zirconium hydrides, utilizing on-the-fly machine learning force ...

On the other hand, physisorptive materials show low enthalpy of adsorption, which denotes low energy consumption for storage, enhanced reversibility under benign conditions, and quick and simple adsorption/desorption cycles, which play a pivotal role in enabling quick hydrogen charging/discharging and facilitating the operational simplicity ...

The affinity of hydrogen molecules to the carbon atoms in network systems leads to the next potential candidates for hydrogen storage - carbon nanostructures [15]. A study of modelled fullerene nanocages loaded with hydrogen reported that a C₆₀ molecule can store maximum of 58 hydrogen molecules inside the cage which is far lesser than the required wt% ...

Both bcc and fcc unit cells expand linearly with the zirconium-to-metal ratio [Zr]/[M], and increased concentration of Zr stabilizes the hydrides. When heated, the hydrides decompose into the original bcc alloys if [Zr]/[M] < 12.5 at.%. ... thermal energy storage, hydrogen energy systems and an outlook is presented for future prospects and ...

Transition metal (TM) catalytic dopants are broadly used in hydrogen storage materials to increase H₂

desorption and absorption kinetics. We have studied H vacancy formation energy in pure, Nb- or Zr- doped bulk ...

Materials for hydrogen-based energy storage - past, recent progress and future outlook. Journal of Alloys and Compounds 2020, 827, 153548. ... The Statistical-Thermodynamic Theory of P--c--T-Dependences for Zirconium--Nickel Alloy ...

In this work, we investigate the hydrogen-storage properties of Zr-decorated γ -graphyne monolayer employing Density Functional Theory (DFT) for green energy storage. We predict that each Zr atom decorated on graphyne sheet (2D) can adsorb up to seven H₂ molecules with an average adsorption energy of -0.44 eV/H₂, leading to a hydrogen ...

When heated, the hydrides phase-separate if the zirconium-to-metal ratio is larger than 12.5 at.% Abstract. We have investigated the structure and hydrogen storage properties of a series of Ti, V, Zr, Nb and Ta based high-entropy alloys (HEAs) with varying degree of local lattice strain by means of synchrotron radiation powder X-ray diffraction ...

In this work, Zr-MOF [33] and Cr-MOF [34] were chosen as representatives of MOFs developed in our laboratory that had shown attractive hydrogen storage properties and good stability. By applying a modulated synthesis method with a shorter crystallization time, our group had previously succeeded in preparing those MOF nanocrystals with a narrow size ...
