

What is ZnO coating?

The ZnO layer can effectively lower the adsorption energy of the Zn (002) plane in ZnO@Zn, inducing the preferential deposition of Zn towards the (002) crystal plane. What is more, the ZnO coating is conducive to reducing corrosion and the generation of by-products, thus increasing the reversibility of Zn²⁺/Zn stripping/plating.

Can ZnO coating reduce adsorption energy?

Particularly, density functional theory (DFT) calculation results reveal that the ZnO coating layer could effectively lower the adsorption energy of the Zn (002) plane in ZnO@Zn, inducing the preferential deposition of Zn²⁺ towards the (002) crystal plane with fewer Zn dendrites.

Why is ZnO coated with MnO?

Benefiting from the heterogenous interface between ZnO and MnO, a strong built-in electric fields generated, which accelerates the electron transport and promotes a fast reaction kinetics. Additionally, the ZnO coating layer effectively alleviates the dissolution of MnO and also boosts its electrical conductivity.

What are the benefits of ZnO coating?

The coated ZnO layers can effectively reduce the contact of electrode and electrolyte, minimize the occurrence of HERs and increase the reversibility of Zn²⁺/Zn stripping/plating [9, 17], which enhance the cycling stability of the ZnO@Zn||MnO₂ cell.

Can ZnO-coated MnO be used as a cathode for aqueous zinc-ion batteries?

In this work, a simple atomic layer deposition strategy is proposed to fabricate ZnO-coated MnO (MnO@ZnO) as cathode for aqueous zinc-ion batteries. Benefiting from the heterogenous interface between ZnO and MnO, a strong built-in electric fields generated, which accelerates the electron transport and promotes a fast reaction kinetics.

What is the zinc storage mechanism of MnO@ZnO?

The zinc storage mechanism of MnO@ZnO was also systematically researched by ex-situ XRD, XPS, and SEM analysis, demonstrating that the MnO is electrochemically activated to produce a layered MnO₂ with H⁺/Zn²⁺ co-insertion mechanism during cycling.

Supercapacitors exhibit exceptional power density, fast charging and discharging rate capabilities, as well as prolonged cycle life. Given the global emphasis on reducing ...

coating carbon ZnO microspheres ... ZnO was widely used in energy storage system account for high theoretical capacity, cheap, and environmentally. Whereas, ZnO had the disappointing electrochemical performance including slow reaction kinetics and quick capacity decay account for its severe volume expansion, and low conductivities of electrical ...

The ZnO coating can refine the grains and make the microstructure of ceramics more compact. ZnO@BBST ceramics have improved relaxation properties. At a ZnO coating content of 2 wt%, ZnO@BBST ceramics exhibit a discharge energy density of 1.91 J/cm³ and an energy storage efficiency of 82 % under an electric field intensity of 320 kV/cm. In ...

Coatings are generally formed over a bulk substrate in order to achieve the properties that are not easily attainable or unattainable with the substrate alone. Therefore, the range and requirement of coatings are very broad for various energy systems. Coatings in the form of thin films are prominently used for solar-based energy systems.

Thin Films and Coatings for Energy Storage and Conversion: From Supercapacitors and Batteries to Hydrogen Generators . by Peter Ondrejka. Peter Ondrejka. SciProfiles ... In the study of Sugianto et al., a graphene oxide (GO/ZnO) composite was synthesized by the hydrothermal technique using various ratio compositions of GO/ZnO. The ...

Recently, aqueous zinc ion batteries (ZIBs) have emerged as a promising energy storage devices because of the ease of assembly, environmental friendliness, and safety features [5], ... Fig. 3 f shows that the plateau overpotential of Zn@ZnO is lower than that of bare Zn, which proves that the ZnO coating facilitates the mass-transfer process ...

The present study reports the successful fabrication of ZnO/a-Fe₂O₃ heterojunctions by facile and simple hydrothermal and spin-coating methods. The effect of spin-coating different FeCl₃ precursor layers on the photoelectrochemical performance has been investigated. Additionally, the procedure of spin-coating FeCl₃ precursors was simulated by ...

Photoluminescence and anti-reflection both have the potential to improve solar cells efficiency. In order to obtain a coating with photoluminescence and anti-reflection both properties, in this paper, ZnO nanoparticles as photoluminescent materials were added into SiO₂ sol to prepare anti-reflection coatings by the dip-coating procedure. Different contents of ...

ZnO can emit coherent photons at room temperature because of their high exciton binding energy (60 meV), elevated breakdown potency, and moderate dielectric constant (3.75) [12]. Being safe, ZnO can be utilized in medical applications without requiring coating, making it an innovative platform for the biomedical field.

The ZnO coating layer on the surface of Si particles can be clearly observed by TEM, ... coupling between Si core and enclosure multifunctional coating layer can satisfy the requirements of practical energy storage devices, such as the ...

Particularly, density functional theory (DFT) calculation results reveal that the ZnO coating layer could effectively lower the adsorption energy of the Zn (002) plane in ZnO@Zn, inducing the preferential deposition

of Zn²⁺ ...

We developed a two-step chemical bath deposition method followed by calcination for the production of ZnO/Co₃O₄ nanocomposites. In aqueous reactions, ZnO nanotubes were first densely grown on Ni foam, and then flat nanosheets of Co₃O₄ developed and formed a porous film. The aspect ratio and conductivity of the Co₃O₄ nanosheets were improved by the ...

Successful coating of ZnO on NMC811 is confirmed by EDS color mapping. In Figure 2, the color mapping and spectra obtained through energy dispersive spectroscopy (EDS) display the distribution of various elements (Zn, Ni, Co, ...

However, due to the dependency of these sources on time and area, insufficient energy storage, and ineffective conversion systems, green energy sources could not be widely commercialized so far. ... A quite different approach was taken by Köse et al. [99], they prepared free-standing MWCNT with ZnO coating through the sol-gel method using ...

In this work, ZnO-coated MnO₂ nanorods are synthesized by a two-step hydrothermal reaction. The MnO₂ nanorods have a length greater than 1 μm and a diameter ...

Mesocrystallinely stabilized lithium storage in high-entropy oxides. Nano Energy. 2024, 124, 109482. Yifei Yuan *, Kun He * and Jun Lu*. Structure-Property Interplay Within Microporous Manganese Dioxide Tunnels For Sustainable Energy Storage.

The energy storage performance of aqueous Zn-ion batteries (AZIBs) is heavily influenced by the condition of the Zn metal anode. ... Zn ions were deposited locally after 5 ...

PANI chains during polymerization formed a coating on the ZnO-BC nanostructures (evident from TEM analysis) and at the same time, interlinked the isolated nanostructures. ... An energy storage system with a double layer mechanism as in EDLC or a fast reversible redox reaction mechanism as in pseudocapacitor is well analyzed and described by ...

At a ZnO coating content of 2 wt%, ZnO@BBST ceramics exhibit a discharge energy density of 1.91 J/cm³ and an energy storage efficiency of 82 % under an electric field ...

Aqueous zinc-ion batteries have been regarded as promising candidates for advanced energy storage devices due to their high capacity and safety. However, they usually suffer from dendrite growth and side reactions, ...

Nanosheets with large surface area are extremely advantageous for energy storage and photocatalytic applications. Graphitic carbon nitride (g-C₃N₄) with a 2D layered structure is a graphite-like layered material and belongs to one of the allotropes of polymeric C₃N₄ (Kumar et al., 2023). Graphitic (g)-C₃N₄ possesses p-conjugated electronic structure with a band ...

Quzhou Institute of Power Battery and Grid Energy Storage, Quzhou, Zhejiang, 324000 China. E-mail: Search for more papers by this author. ... a nanometer-thick ZnO coating layer with a uniform concave surface geometry is in situ constructed to modify the Zn anode for the first time. The ...

Development of photocatalytic and electrocatalytic coatings via thermal spraying for environmental and energy storage applications: a short review December 2024 Surface Science and Technology 2(1 ...

generation energy storage devices [1-3]. However, the current electrode materials have limited specific charge storage capacity and cannot achieve the energy density, power density, and cycle times that all the important applications such as portable electronics and electric vehicles require [2]. Siis

In this paper, we report a mixed metal oxide ZnO-ZnCr₂O₄ coating material. This material has several functions, including providing a fast ion transport channel, preferentially ...

Aqueous zinc metal batteries (AZMBs) are considered a promising candidate for grid-scale energy storage systems owing to their high capacity, high safety and low cost. However, Zn anodes suffer from notorious ...

1. Introduction. The development of energy-harvesting technologies to meet the increasing energy demand has garnered considerable attention in the research community [1 - 3]. The harvesting of ambient energy, e.g., vibrational, wind, thermal, and solar energies, is being actively explored for advanced energy-harvesting applications based on the pyroelectric, ...

The ZnO coating layer effectively enhances the air stability of PW and induces the formation of the stable interface on PW. The PW-5 wt % ZnO-E (exposed in 60% humidity air after 30 days) cathode demonstrates a much ...

Besides, Romero et al. [20] reported that in order to be properly suitable for acoustic wave devices, polycrystalline ZnO thin films must meet two requirements. First, the basal plane of ZnO crystallites must be oriented parallel to the plane of the substrate (c-axis orientation). Second, the ZnO thin films must have a columnar structure with void-free grain ...

Storage stability of zinc-nickel batteries with (a) ZnO and (b) ZnO@ZnS 350 composite electrode by fully charged and then rested for 48 h followed by discharged to 1.2 V at a discharge current of 1.25 A. (c) Rate performances of zinc-nickel batteries with ZnO and ZnO@ZnS 350 composite electrodes under different discharge current.

ALD is an effective technique to modify the surface property of an electrode with ultrathin coating film. Previous research has reported that ALD-Al₂O₃ layer can protect the Li metal from air corrosion [39], reduce the dendrite growth as well as improve the cycle life [40]. Zhang et al. [41] also used ALD-Al₂O₃ as

an artificial SEI layer to modify carbon ...

The submicron relaxation $\text{Ba}_{0.8}\text{Sr}_{0.2}\text{Zr}_{0.1}\text{Ti}_{0.9}\text{O}_3$ (BSZT) as a starting material, MgO as a high dielectric breakdown strength (BDS) material, and $\text{ZnO-B}_2\text{O}_3\text{-SiO}_2$ (ZBSO) as a sintering agent, rationally designed BSZT@MgO@ZBSO particles (diameter about 270 nm) with high uniformity and dispersity have been fabricated by a double-coating ...
